Weaving spiritual applications throughout the article, the authors incorporate a plethora of references to substantiate that maltreatment has a direct connection to attachment disorders. They provide articulate and heavily-supported reasoning, detailing the specific causes of maternal deprivation individually and then incorporating them in a broader sense to answer the article’s title in the affirmative.

This longitudinal study tracked 31 Israeli children from ages 3 months to 13 years (infancy to adolescence). There were direct parallels noted between increased attachment/coherence and the child’s moral cognition, empathy development, and verbal IQ. Toddlers who were able to regulate their own behavior later proved to excel in lead-lag structures and language skills.
